Multi Camera System Calibration

**Goal:** Automatic calibration routine for a multi-camera stereo setup

**Description:**
An FPGA featured board includes 8 cameras to support wide field of view applications. As the camera arrangement is not restricted to a single use case a calibration routine is needed.

The cameras intrinsic and extrinsic parameters need to be estimated in order to perform stereo matching.

Based on the parameters the FPGA board performs real-time correction.

**Tasks:**
- Calibration routine for intrinsic/extrinsic parameters of one camera pair.
- Extend routine to support multiple camera pairs.
- Upload parameters to the FPGA board.

**Requirements / Tools:**
OpenCV / C++

**Supervisor:**
Dominik Honegger / Peidong Liu
